AB Azoreductases have been characterized as enzymes that can decolorize azo dyes by reducing azo groups. In this study, genes encoding proteins having homol. with the azoreductase gene of Bacillus sp. OY1-2 were obtained from Bacillus subtilis ATCC6633, B. subtilis ISW1214, and Geobacillus stearothermophilus IFO13737 by polymerase chain reaction. All three genes encoded proteins with 174 amino acids. The deduced amino acid sequences of azoreductase homologs from B. subtilis ISW1214, B. subtilis ATCC6633, and G. stearothermophilus IFO13737 showed similarity of 53.3, 53.9, and 53.3% resp. to that of Bacillus sp. OY1-2. All three genes were expressed in Escherichia coli, and were characterized as having the decolorizing activity of azo dyes in a β-NADPH dependent manner. The transformation of several azo dyes into colorless compds. by recombinant enzymes was demonstrated to have distinct substrate specificity from that of azoreductase from Bacillus sp. OY1-2.

AB The invention relates to a method for producing a liquid formulation of salts of sulfonic-acid azo dyes by the coupling of at least an equimolar quantity of diazotized H2NArSO3H with products of the self-coupling products of phenylenediamine, which can be optionally substituted by Me. In said formula, Ar represents phenylene, which can be monosubstituted by sulfo, or naphthylene, which can be monosubstituted or disubstituted by sulfo and/or monosubstituted by hydroxy. According to the method, the azo dye is prepared as a basic solution without isolation of the dye, and then the solution is subjected to a nanofiltration to give a storage-stable solution Thus, coupling of m-phenylenediamine (I) with diazotized I in water, adjusting the pH to 3 with NaOH, coupling of diazotized sulfanilic acid with the intermediate in suspension, adjusting the pH to 5 with NaOH, and adjusting the pH to 9.5 with aqueous NH3, clarifying the solution by filtration (filtration residue <0.1%) gave a dye solution, and refiltering the solution through a nanofiltering membrane with the separation layer being TiO2, pore size being 0.9 nm, and flow rate being 20.7 kg/m2 h, and concentrating the filtrate by a concentration factor of 2.13 gave a C.I. Direct Brown 44 dye solution containing 97.9% solids.

IT 6252-62-6P, C.I. Direct Brown 44

OS MARPAT 141:25073
AB Aqueous solution of C.I. Direct Brown 44, useful for dyeing of paper, was manufactured by (a) preparing vesuvine from m-phenylenediamine, (b) coupling the vesuvine without isolation with at least an equimolar quantity of diazotized

aminoaryl sulfonic acid H2NArSO3H [Ar = (sulfo)phenylene; (OH and/or sulfo-substituted) naphthylene], and (c) isolation of the dye in acidic form and subsequent dissoln. in aqueous base. For example, the diazo component solution was prepared by dissolving 170 g sulfanilic acid in solution of 157 parts 25% aqueous NaOH in 1300 parts H2O, adding 1300 parts ice and 335 parts of 23% aqueous NaNO2 solution, adding 447 parts of 20% HCl and destroying the excess nitrite with sulfamic acid. The diazo component was added to the coupling component solution containing 173 parts vesuvine base in 2500 parts ice/H2O mixture, the pH was adjusted to 5.0-6 (aqueous NaOH), after the coupling reaction was completed the pH value was lowered to pH 1 with HCl and the resulting solid was separated by filtration and dried to give 360 g C.I. Direct Brown 44 containing 1.5% NaCl. Dissolving 20 g of the wet filter cake of the above dye and 5 parts 1,2-propanediol in 72 parts diluted aqueous NaOH (pH 10-12) and clarification gave a dye solution useful for coloration of paper.

AB The title compns. comprise brown dyes I [R = Li, NH2(CH2CH2OH)2, NH(CH2CH2OH)3; n = 1, 2] and water soluble polyalkylene glycols, and are

useful in manufacture of paper and leather. Thus, Na naphthionate was diazotized, the diazonium salt treated with C.I. Basic Brown 1, H2O, polyethylene glycol, and urea at 10° , the pH adjusted to 8 by (HOCH2CH2)3N, and then H2O was added at 30° . This solution (A) was storage-stable for 6 mo. A pulp solution was mixed with A, a size, and anhydrous Al2(SO4)3, and was used to prepare uniformly brown paper.

AB The title method in the suspension or emulsion polymerization of vinyl monomer(s) comprises (A) reducing surface roughness of the reactor wall to <5 μm and (B) coating the reactor and auxiliary equipment of monomer contact, with dye and/or pigment. Thus, a polymerization reactor (surface roughness 0.4-0.7 μm) coated with Solvent Black 5 exhibited no scale deposit even after 150 batches of polymerization of vinyl chloride, while a control (surface roughness 0.2-0.3 μm), without such a coating, was all covered with thick scale deposit after 10 batches.

AB Uniformly colored shaped articles such as contact lenses are prepared by immersing an acrylate polymer in a dyeing solution containing a water-soluble dye in a solvent capable of swelling the polymer and drying the article. Discoloration or fading due to oozing out of the dye is prevented by uniformly penetrating or dispersing the dye into the swollen lipophilic polymers. A polymer contact lens, prepared from acrylic acid, Bu methacrylate, and ethylene glycol dimethacrylate, was immersed in PrOH and 1% MeSO3H was added and the mixture refluxed for 24 h to complete esterification and the lens then washed with PrOH. The lens was immersed in a MeOH solution of C.I. Acid Blue 9 (C.I. 42090) [2650-18-2] for 1 h and the swollen and colored lens dried at 95° for 16 h and washed with H2O to remove surface dye. No discoloration occurred when the lens was boiled in distilled H2O for 7 days.

AB The behavior of 48 direct dyes at >100° was investigated. Modifications in the spectral characteristics (CA 57, 6069h) and results of actual dyeing of cotton fibers in neutral (0.5 and 1 h.) and in alkaline (4% Na2CO3, 0.5 h.) media were determined in the presence of 10% Na2SO4-all at normal temperature and at 120°. The heat resistance of the dyes was lower in alkaline than in neutral media. In the latter, the heat resistance of the direct dyes was remarkable, only Direct Brilliant Orange and Direct Resistant Ruby L2A being unusable. The results showed that the benzidine disazo and the stilbene dyes have remarkable heat resistance, while the dyes derived from the carbonyl J acid have a lower stability. In general, stability of the dyes was the same when heated in the absence or in the presence of cotton, but in some cases the heat resistance was improved by the cotton. The role of the secondary dyes in the final behavior of the products examined was also discussed.

AB cf. C.A. 40, 4037.1. Toluylene brown G (I), to which has been ascribed the formula (II), is prepared in the usual manner by coupling m-C6H4(NH2)2 (IV) with tetrazotized 3,5-diamino-p-toluene-sulfonic acid (V) and found to have an atomic ratio N:S of 6:0.99, verifying the equimolar ratio demanded by the formula. However, II contains a heterocyclic 10-membered ring which is improbable from theoretical considerations. Diffusion

expts. indicate that I is an ion-colloid rather than a simple mol. Therefore, a chain structure (III) seems more probable than a ring configuration. Reductive splitting would not clarify the problem because either structure would yield the same products. Blocking one of the amino groups of V by acetylation to form monoacetyl-3,5-diamino-p-toluenesulfonic acid (VI), C9H12O4N2S.2H2O, followed by diazotization, produces a compound which couples with IV to yield a brick-red monoazo dye (VII) which on hydrolysis with 5% NaOH for 6 hrs. gives the brown dye (VIII). VIII ("opentoluylene brown") is not a substantive dye but has the characteristics of a wool dye. VIII does become substantive when it is converted into a disazo dye by the addition of another mol. of IV to produce (IX) (Phd.N2.Tds.N2.Phd) [Phd = phenylenediamine residue;Tds = diaminotoluenesulfonic acid residue]. Coupling of diazotized VI with VIII produces a mono-Ac disazo dye (X) (AcTds.N2.Phd.N2.Tds). Diazotization of X followed by coupling with IX gives a compound which on deacetylation yields a pentakisazo dye (XI) (Tds.N2.Phd.N2.Tds.N2.Phd.N2.Tds.N2.Phd). Thus XI is III with a definite chain length. The phys. and chemical properties of I are very much like those of XI, confirming the chainlike structure assigned to it.

AB   The invention relates to aqueous liquid formulations containing 5-30% of a dye
     composition that comprises 25-85% of Direct brown
     44, 15-75% of Direct yellow 11 and/or a dye obtained by reducing
     or thermally treating direct yellow 11, 0-15% of ≥1 Direct blue
     dyes, and 0-10% of ≥1 direct red dyes, 0.5-15% of ≥1
     alkylamines, the one, two, or three alkyl groups of which can be
     substituted by one or two hydroxyl groups and/or amino groups and/or be
     interrupted by one or two oxygen atoms having an ether function, the Na
     concentration of the liquid formulation not exceeding 0.3%.

AB The invention relates to a method for producing a liquid formulation of salts of sulfonic-acid azo dyes by the coupling of at least an equimolar quantity of diazotized H2NArSO3H with products of the self-coupling products of phenylenediamine, which can be optionally substituted by Me. In said formula, Ar represents phenylene, which can be monosubstituted by sulfo, or naphthylene, which can be monosubstituted or disubstituted by sulfo and/or monosubstituted by hydroxy. According to the method, the azo dye is prepared as a basic solution without isolation of the dye, and then the solution is subjected to a nanofiltration to give a storage-stable solution Thus, coupling of m-phenylenediamine (I) with diazotized I in water, adjusting the pH to 3 with NaOH, coupling of diazotized sulfanilic acid with the intermediate in suspension, adjusting the pH to 5 with NaOH, and adjusting the pH to 9.5 with aqueous NH3, clarifying the solution by filtration (filtration residue <0.1%) gave a dye solution, and refiltering the solution through a nanofiltering membrane with the separation layer being TiO2, pore size being 0.9 nm, and flow rate being 20.7 kg/m2 h, and concentrating the

filtrate by a concentration factor of 2.13 gave a C.I. Direct Brown 44 dye solution containing 97.9% solids.

OS MARPAT 141:25073
AB Aqueous solution of C.I. Direct Brown 44, useful for dyeing of paper, was manufactured by (a) preparing vesuvine from m-phenylenediamine, (b) coupling the vesuvine without isolation with at least an equimolar quantity of diazotized aminoaryl sulfonic acid H2NArSO3H (Ar = (sulfo)phenylene; (OH and/or sulfo-substituted) naphthylene), and (c) isolation of the dye in acidic form and subsequent dissoln. in aqueous base. For example, the diazo component solution was prepared by dissolving 170 g sulfanilic acid in solution of 157 parts 25% aqueous NaOH in 1300 parts H2O, adding 1300 parts ice and 335 parts of 23% aqueous NaNO2 solution, adding 447 parts of 20% HCl and destroying the excess nitrite with sulfamic acid. The diazo component was added to the coupling component solution containing 173 parts vesuvine base in 2500 parts ice/H2O mixture, the pH was adjusted to 5.0-6 (aqueous NaOH), after the coupling reaction was completed the pH value was lowered to pH 1 with HCl and the resulting solid was separated by filtration and dried to give 360 g C.I. Direct Brown 44 containing 1.5% NaCl. Dissolving 20 g of the wet filter cake of the above dye and 5 parts 1,2-propanediol in 72 parts diluted aqueous NaOH (pH 10-12) and clarification gave a dye solution useful for coloration of paper.
